- Seshadri criterion for ampleness of a line bundle.

## Theorem (Seshadri criterion)

Let X be a projective variety and  $\mathcal{L}$  be a line bundle on X. Then  $\mathcal{L}$  is ample if and only if  $\exists \epsilon > 0$  such that

$$\mathcal{L} \cdot \mathcal{C} \geq \varepsilon \cdot \textit{mult}_{x}\mathcal{C},$$

for every  $x \in X$  and every irreducible curve  $C \subset X$  passing through x.

Motivated by the above criteria, Demailly defined the Seshadri constants of an ample line bundle to quantify the positivity of ample line bundle.

Definition (Seshadri constant at a point, Demailly, 1987)

Let X be a projective variety and  $\mathcal{L}$  be an ample (nef) line bundle on X, then the Seshadri constant of  $\mathcal{L}$  at a point  $x \in X$  is defined as

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

$$\varepsilon(X;\mathcal{L},x):=\inf_{x\in C\subset X}\left\{\frac{\mathcal{L}\cdot C}{mult_xC}\right\}.$$

## Alternate realisation of Seshadri constant of a line bundle at a point.

(ロ)、(型)、(E)、(E)、 E) の(()

- Alternate realisation of Seshadri constant of a line bundle at a point.
- Let X be a projective variety and L a nef line bundle on X. Let x ∈ X be a point and consider the blow up of X at x

$$\pi: Bl_{x}X \to X$$

such that E is the exceptional divisor. Then,

$$\varepsilon(X; L, x) = \max\{\lambda : \pi^*L - \lambda \cdot E \text{ is nef}\}.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Alternate realisation of Seshadri constant of a line bundle at a point.
- Let X be a projective variety and L a nef line bundle on X. Let x ∈ X be a point and consider the blow up of X at x

$$\pi: Bl_X X \to X$$

such that E is the exceptional divisor. Then,

$$\varepsilon(X; L, x) = \max\{\lambda : \pi^*L - \lambda \cdot E \text{ is nef}\}.$$

▶ Note that  $\pi^* L - \lambda \cdot E$  is nef gives

$$egin{array}{rcl} (\pi^*L-\lambda)^n &\geq & 0, \ \Rightarrow & L^n &\geq & \lambda^n, \ \Rightarrow & \sqrt[\eta]{L^n} &\geq & \lambda. \end{array}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

$$\varepsilon(X;L) := \inf_{x \in X} \varepsilon(X;L,x)$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▶

$$\varepsilon(X; L) := \inf_{x \in X} \varepsilon(X; L, x)$$

$$\varepsilon(X; L, r) := \sup_{x_1, x_2, \dots, x_r \in X} \varepsilon(X; L, x_1, x_2, \dots, x_r)$$

$$\varepsilon(X; L) := \inf_{x \in X} \varepsilon(X; L, x)$$

$$\varepsilon(X; L, r) := \sup_{x_1, x_2, \dots, x_r \in X} \varepsilon(X; L, x_1, x_2, \dots, x_r)$$

$$\triangleright \ \varepsilon(X;L,x_1,x_2,...,x_r) := \inf_{C \cap \{x_1,x_2,...,x_r\} \neq \phi} \frac{L \cdot C}{\sum\limits_{i=1}^{i=r} mult_{x_i} C}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▶

$$\varepsilon(X; L) := \inf_{x \in X} \varepsilon(X; L, x)$$

$$\varepsilon(X; L, r) := \sup_{x_1, x_2, \dots, x_r \in X} \varepsilon(X; L, x_1, x_2, \dots, x_r)$$

$$\varepsilon(X; L, x_1, x_2, \dots, x_r) := \inf_{x_1, x_2, \dots, x_r} \frac{L \cdot C}{C}$$

$$\blacktriangleright \ \varepsilon(X; L, x_1, x_2, \dots, x_r) := \inf_{\substack{C \cap \{x_1, x_2, \dots, x_r\} \neq \phi \ \sum_{i=1}^{i=r} mult_{x_i} C}} \prod_{i=1}^{L \cdot C} mult_{x_i} C$$

It is easy to see that the following set of inequalities holds

$$0 < \varepsilon(X; L) \le \varepsilon(X; L, x) \le \varepsilon(X; L, 1) \le \sqrt[n]{L^n}.$$

Here n is the dimension of X.

#### Example

Let  $X = \mathbb{P}^n$  and  $L = \mathcal{O}(1)$  be a an ample line bundle on X. Then

$$\varepsilon(X;L,x)=1,$$

for every  $x \in X$ .

#### Proof.

Fix  $x \in X$ . Let  $\ell \subset X$  denote the line passing through x. Therefore we get  $\varepsilon(X, L, x) \leq (L \cdot \ell)/1 = 1$ . Now, let  $C \subset X$  be a curve of degree d passing through x with multiplicity m, then Bézout's theorem says that  $d \geq m$ . Therefore  $d/m \geq 1$ . Hence  $\varepsilon(X, L, x) = 1$ .

#### Example

Let  $p_1, p_2, p_3 \in \mathbb{P}^2$  are three points and  $\ell \subset \mathbb{P}^2$  denotes a line. Then the multi-point Seshadri constant

$$arepsilon(\mathbb{P}^2; l, p_1, p_2, p_3) = egin{cases} rac{1}{3}, \ ext{if the points are collinear} \ rac{1}{2}, \ ext{else.} \end{cases}$$

#### Sketch of the proof:

Collinear: Let  $l \subset \mathbb{P}^2$  be the line containing those points. Then  $\varepsilon(\mathbb{P}^2; l, p_1, p_2, p_3) \leq (l \cdot l)/3 = 1/3$ . If  $C \subset \mathbb{P}^2$  be any curve containing these points with multiplicities  $m_1, m_2, m_3$  then Bézout's theorem gives

$$egin{array}{rcl} \deg(\mathcal{C}) = \mathcal{C} \cdot \mathcal{I} &\geq m_1+m_2+m_3, \ \Rightarrow \displaystylerac{\deg(\mathcal{C})}{m_1+m_2+m_3} &\geq 1>\displaystylerac{1}{3}. \end{array}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Non-collinear: Let  $l \subset \mathbb{P}^2$  denote the line passing through any two of the points. Then we get  $\varepsilon(\mathbb{P}^2; l, p_1, p_2, p_3) \leq (l \cdot l)/2 = 1/2$ . As in the previous case take *C* be any curve of degree *d* passing with  $p_i$  with multiplicity  $m_i$ . Then using bezouts theorem

$$egin{aligned} d &= C \cdot l_3 \geq m_1 + m_2, \ d &= C \cdot l_2 \geq m_1 + m_3, \ d &= C \cdot l_1 \geq m_2 + m_3, \ &\Rightarrow 3d \geq 2(m_1 + m_2 + m_3), \ &\Rightarrow d/(m_1 + m_2 + m_3) \geq 2/3 > 1/2. \end{aligned}$$

Seshadri constant was introduced by Demailly to understand the following conjecture.

# Conjecture (Fujita, 1987)

Let X be a smooth projective algebraic variety of dimension n over an algebraically closed field of characteristic zero. Let  $K_X$  be the canonical line bundle on X and A be an ample Cartier divisor on X. Then the adjoint line bundle

- 1.  $\mathcal{O}_X(K_X + mA)$  is globally generated for all  $m \ge n + 1$ ,
- 2.  $\mathcal{O}_X(K_X + mA)$  is very ample for all  $m \ge n + 2$ .

The following theorem relates the Fujita's conjecture with the Seshadri constants.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

## Theorem (Ein, Lazarsfeld)

Let X be a smooth projective variety of dimension n. Let  $K_X$  be the canonical line bundle on X and L be a big and nef line bundle on X. Then,

1.  $\varepsilon(L, x) > n$  for all  $x \in X \implies K_X + L$  is globally generated.

2.  $\varepsilon(L, x) > n + 1$  for all  $x \in X \implies K_X + L$  is very ample.

The following theorem relates the Fujita's conjecture with the Seshadri constants.

# Theorem (Ein, Lazarsfeld)

Let X be a smooth projective variety of dimension n. Let  $K_X$  be the canonical line bundle on X and L be a big and nef line bundle on X. Then,

- 1.  $\varepsilon(L, x) > n$  for all  $x \in X \implies K_X + L$  is globally generated.
- 2.  $\varepsilon(L, x) > n + 1$  for all  $x \in X \implies K_X + L$  is very ample.

Note that

$$\varepsilon(L,x) > 1, \ \forall \ x \in X \ \Rightarrow \ \varepsilon(mL,x) > n, \ \forall \ m \ge n+1.$$

Since,

$$\varepsilon(L,x) > 1 > n/m \Rightarrow \varepsilon(mL,x) > n.$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

By the previous theorem of Ein and Lazarsfeld we get

- 1.  $\varepsilon(mL, x) > n$  for all  $x \in X \Rightarrow K_X + mL$  is globally generated for  $m \ge n + 1$ ,
- 2.  $\varepsilon(mL, x) > n+1$  for all  $x \in X \Rightarrow K_X + mL$  is very ample for  $m \ge n+2$ .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

By the previous theorem of Ein and Lazarsfeld we get

- 1.  $\varepsilon(mL, x) > n$  for all  $x \in X \Rightarrow K_X + mL$  is globally generated for  $m \ge n + 1$ ,
- 2.  $\varepsilon(mL, x) > n+1$  for all  $x \in X \Rightarrow K_X + mL$  is very ample for  $m \ge n+2$ .

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

Therefore we see that ε(L, x) > 1 for all x ∈ X implies the Fujita's conjecture.

By the previous theorem of Ein and Lazarsfeld we get

- 1.  $\varepsilon(mL, x) > n$  for all  $x \in X \Rightarrow K_X + mL$  is globally generated for  $m \ge n + 1$ ,
- 2.  $\varepsilon(mL, x) > n+1$  for all  $x \in X \Rightarrow K_X + mL$  is very ample for  $m \ge n+2$ .
- ► Therefore we see that ε(L, x) > 1 for all x ∈ X implies the Fujita's conjecture.
- But it is too optimistic to prove that ε(L, x) > 1 for all x ∈ X, as the following example of Miranda suggests.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ● ●

## Example (Miranda)

For any given  $\delta > 0$  there exists a smooth projective surface X, a point  $x \in X$  and an ample line bundle L on X such that

$$\varepsilon(X;L,x) < \delta.$$

Sketch of the proof : Consider a curve  $\Gamma \subset \mathbb{P}^2$  of degree *d* having an *m*-fold point  $p \in \Gamma$ , with  $\delta > 1/m$ . Choose a second curve  $\Gamma' \subset \mathbb{P}^2$  of degree *d* that meets  $\Gamma$  transversely. We can choose d >> 0 and  $\Gamma'$  sufficiently general so that the linear system  $\mathcal{L}$ generated by  $\Gamma$  and  $\Gamma'$  are irreducible. We then consider the surface obtained after the blow up of base points of this system.

$$\mu: X := Bl_{\Gamma \cap \Gamma'}(\mathbb{P}^2) \longrightarrow \mathbb{P}^2$$

Let X be smooth complex projective variety and L be a line bundle on X. Consider the linear system |mL| for  $m \in \mathbb{N}$ . The global sections of mL defines a rational map

$$\phi_{mL}: X \dashrightarrow \mathbb{P}(H^0(X, mL)).$$

Clearly, the  $dim(\phi_{mL}(X)) \leq dim(X)$ .

#### Definition

 $\kappa(X,L) := \max\{\dim(\phi_{mL}(X)) : m \in \mathbb{N}\}.$ 

#### Definition

Given a smooth complex projective variety X with canonical divisor  $K_X$ , the Kodaira dimension of X is defined as  $\kappa(X, K_X)$ .

# Introduction of Hyperelliptic surfacces

## Definition

A hyperelliptic surface X is a minimal smooth surface with Kodaira dimension  $\kappa(X) = 0$  satisfying  $h^1(X, \mathcal{O}_X) = 1$  and  $h^2(X, \mathcal{O}_X) = 0$ .

#### Alternate characterization

A smooth surface X is hyperelliptic if and only if  $X \cong (A \times B)/G$ , where A and B are elliptic curves and G is a finite group of translation of A acting on B in such a way that  $B/G \cong \mathbb{P}^1$ . We have the following diagram:

A D N A 目 N A E N A E N A B N A C N

• Fibres of  $\phi$  are smooth and isomorphic to  $\mathbb{P}^1$ .

- Fibres of  $\phi$  are smooth and isomorphic to  $\mathbb{P}^1$ .
- Fibres of \u03c6 are all multiples of smooth elliptic curves and all but finitely many of them are smooth and isomorphic to A

Let μ = lcm(m<sub>1</sub>, m<sub>2</sub>, ...m<sub>s</sub>) and γ = |G|, then Num(X) is generated by A/μ and (μ/γ)B.

A line bundle L on X is represented by  $L \equiv a \frac{A}{\mu} + b(\frac{\mu}{\gamma})B$ .

Intersection product on X is governed by

$$A^2 = B^2 = 0,$$
$$A \cdot B = |G|$$

- Let μ = lcm(m<sub>1</sub>, m<sub>2</sub>, ...m<sub>s</sub>) and γ = |G|, then Num(X) is generated by A/μ and (μ/γ)B.
- ► A line bundle *L* on *X* is represented by  $L \equiv a_{\mu}^{\underline{A}} + b(\frac{\mu}{\gamma})B$ .

Intersection product on X is governed by

$$A^2 = B^2 = 0,$$
$$A \cdot B = |G|$$

A D N A 目 N A E N A E N A B N A C N

• *L* is ample if and only if a, b > 0.

- Let μ = lcm(m<sub>1</sub>, m<sub>2</sub>, ...m<sub>s</sub>) and γ = |G|, then Num(X) is generated by A/μ and (μ/γ)B.
- A line bundle *L* on *X* is represented by  $L \equiv a\frac{A}{\mu} + b(\frac{\mu}{\gamma})B$ .

Intersection product on X is governed by

$$A^2 = B^2 = 0,$$
$$A \cdot B = |G|$$

- *L* is ample if and only if a, b > 0.
- There are seven types of hyperelliptic surfaces depending on G.

#### Theorem

Let  $X \cong (A \times B)/G$  be a hyperelliptic surface. A basis for the group Num(X) of divisors modulo numerical equivalence and the multiplicities of the singular fibres of  $\Psi : X \to B/G$  in each type are given in the following table.

Type of X	G	$m_1, m_2, \ldots, m_s$	Basis of Num(X)
1	$\mathbb{Z}_2$	2, 2, 2, 2	A/2, B
2	$\mathbb{Z}_2\times\mathbb{Z}_2$	2, 2, 2, 2	A/2, B/2
3	$\mathbb{Z}_4$	2, 4, 4	A/4, B
4	$\mathbb{Z}_4\times\mathbb{Z}_2$	2, 4, 4	A/4,B/2
5	$\mathbb{Z}_3$	3, 3, 3	A/3, B
6	$\mathbb{Z}_3\times\mathbb{Z}_3$	3, 3, 3	A/3, B/3
7	$\mathbb{Z}_6$	2, 3, 6	A/6, B

## Theorem (Hanumanthu, Roy)

Let X be a hyperelliptic surface of type different from 6 and let L be an ample line bundle on X. Then  $\varepsilon(L) \in \mathbb{Q}$ .

#### Proof

Let X be of type 1 hyperelliptic surface. Let  $L \equiv (a, b)$  be an ample line bundle. We can also write L as  $a \cdot \frac{A}{2} + b \cdot B$  where A/2 and B are the generators of Num(X). Notice that, through any point  $x \in X$  there are copies of A and B passing through it. Therefore,

$$\varepsilon(X,L) \leq \frac{L \cdot B}{mult_{x}B} = a,$$
  
$$\varepsilon(X,L) \leq \frac{L \cdot A}{mult_{x}A} = \frac{2b}{2} = b.$$

Therefore we see that  $\varepsilon(X, L) \leq \min(a, b)$ . Now, we will show that  $\varepsilon(X, L) \geq \min(a, b)$ . To this end, let  $C \equiv s \cdot A/2 + t \cdot B \ (\neq A, B)$  be a reduced and irreducible curve in X passing through x with multiplicity m. Then by Bézout's theorem we get

$$s = C \cdot B \ge m \cdot 1 \Rightarrow bs \ge bm,$$
  
 $2t = C \cdot A \ge m \cdot 2 \Rightarrow at \ge am.$ 

Thus we have

$$\frac{L \cdot C}{m} = \frac{at + bs}{m} \ge a + b \ge \min(a, b),$$

A D N A 目 N A E N A E N A B N A C N

and therefore  $\varepsilon(X, L) = \min(a, b)$ .

In fact it is true that  $\varepsilon(X; L) = \min(a, b)$  for all ample line bundle on every hyperelliptic surfaces of odd type. For even type, except of type 6, we show that  $\varepsilon(X; L, x) < \sqrt{L^2} = \sqrt{2ab}$  for some  $x \in X$ . Then the proof follows from the following theorem

## Theorem (Bauer, Szemberg)

Let X be a smooth projective surface and L be an ample line bundle on X. If there exists a point  $x \in X$  such that  $\varepsilon(X, L, x) < \sqrt{L^2}$ , then  $\varepsilon(X, L) \in \mathbb{Q}$ .

## Theorem (Hanumanthu, Roy)

Let X be a hyperelliptic surface and let L be an ample line bundle on X. If  $\varepsilon(L, 1) < (0.93)\sqrt{L^2}$ , then  $\varepsilon(L, 1) = \min(L \cdot A, L \cdot B)$ .

## Definition (Surface of General type)

A smooth complex algebraic surface X is said to be of general type if the Kodaira dimension  $\kappa(X) = 2$ .

#### Example

Let  $S = C \times D$  where C and D are two curves of genus  $\geq 2$  then S is a surface of general type. Now let p and q denotes the two projection then  $K_S = p^*(K_C) \otimes q^*(K_D)$  and the rational map  $\phi_{nK_S} : S \dashrightarrow \mathbb{P}^N$  factorises as

$$\phi_{nK_{S}}: C \times D \xrightarrow{(\phi_{nK_{C}}, \phi_{nK_{D}})} \mathbb{P}^{N_{1}} \times \mathbb{P}^{N_{2}} \stackrel{s}{\hookrightarrow} \mathbb{P}^{N_{1}}$$

where s is the Segre embedding (defined by  $(x_i), (y_j) \mapsto (x_iy_j)$ ). Since  $\kappa(C) = \kappa(D) = 1$  we see that  $\kappa(S) = 2$  and hence S is a surface of general type. In fact if S is any surface fibred over a curve of genus at least 2, whose generic fibre is of genus at least two, is a surface of general type.

# Multi-point Seshadri constant

#### Theorem

Let X be a surface of general type and  $K_X$  be the canonical line bundle on X. If  $K_X$  is big and nef and  $x_1, x_2, ..., x_r \in X$  are  $r \ge 2$ points, then we have the following.

- 1.  $\varepsilon(X; K_X, x_1, x_2, ..., x_r) = 0 \Leftrightarrow$  at least one of  $x_i$  lies on one of the finitely many (-2)-curves on X.
- 2. If  $0 < \varepsilon(X; K_X, x_1, x_2, ..., x_r) < \frac{1}{r}$ , then the Seshadri curve C satisfies  $K_X \cdot C \le 2$  and

$$\varepsilon(X; K_X, x_1, x_2, ..., x_r) = \begin{cases} \frac{1}{3} \text{ or } \frac{1}{4} \text{ or } \frac{2}{5} & \text{if } r = 2, \\ \frac{1}{r+1} \text{ or } \frac{1}{r+2} & \text{if } 3 \le r < 9, \\ \frac{1}{r+1} \text{ or } \frac{1}{r+2} \text{ or } \frac{1}{r+3} & \text{if } r \ge 9. \end{cases}$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

#### Theorem

Let  $X = C \times C$ , where C is a general member of moduli of smooth curves of genus  $g \ge 2$ . Let  $L \equiv_{num} a_1F_1 + a_2F_2 + a_3\delta$  be an ample line bundle satisfying any of the following conditions on  $a_1, a_2$  and  $a_3$ .

1. 
$$a_3 = 0$$
,  
2.  $a_3 > 0$ ,  $a_1 \le a_2$  and  $a_1^2 + a_3^2 < 2a_1a_2$ ,  
3.  $a_3 < 0$  and  $a_2 \ge \left(\frac{2gk^2 + 2k + 1}{2(k+1)}\right) \cdot a_1$ , where  $k = \lceil \frac{|a_3|/a_1}{1 - |a_3|/a_1} \rceil$ .  
Then  $\varepsilon(X; L) \in \mathbb{Q}$ .
